

Bitcoin miner simulator in Python (in English)

February 16, 2025

The following steps describe how to create a bitcoin miner simulator entirely in Python.

1 LIBRARY IMPORT

```
[33]: import hashlib
```

2 ASSIGNING PARAMETER VALUES IN INPUT

```
[34]: NONCE_LIMIT=int(input("Enter the maximum number of attempts to find a valid_  
    ↳ hash (the higher the number, the longer it will take) (e.g., 1000000 for a_  
    ↳ quick test, 1000000000000 for a real scenario): "))  
zeroes_limit=int(input("How many leading zeros should the hash have to be_  
    ↳ considered valid? (The higher the number, the harder the difficulty) (e.g.,_  
    ↳ 2 for an easy test, 6 for a more challenging computation): "))
```

```
[35]: block_number=int(input("Enter the block number. This is a unique identifier for_  
    ↳ the block in the blockchain (e.g., 24 for a test block, 100000 for a real_  
    ↳ blockchain scenario): "))  
transactions=str(input("Enter the transaction data. This represents the_  
    ↳ transactions included in the block, written as a single string (e.g.,_  
    ↳ '123abc' for a simple transaction, 'tx1_tx2_tx3' for multiple transactions_  
    ↳ separated by underscores): "))  
previous_hash=str(input("Enter the previous block's hash. This is the unique_  
    ↳ hash of the previous block, ensuring the integrity of the chain (e.g.,_  
    ↳ '0000abcd1234' for a simple hash, 'f3a5c6d7e8b9...' for a real blockchain_  
    ↳ hash): "))
```

3 CREATING THE BITCOIN MINING ALGORITHM

```
[36]: def bitcoin_mining(block_number, transactions, previous_hash):  
    global numberhashesfound  
    valid_hashes_found_count=0 # Count the total number of valid hashes found  
    for nonce in range(NONCE_LIMIT): # Iterate over possible nonce values up to_  
    ↳ the limit  
        base_text=str(block_number)+transactions+previous_hash+str(nonce)
```

```

        hash_attempt=hashlib.sha256(base_text.encode()).hexdigest() # Generate
↳the SHA-256 hash
        if hash_attempt.startswith("0"*zeroes_limit): # Check if the hash meets
↳the difficulty target
            valid_hashes_found_count+=1 # Increment the counter for valid hashes
            print(f"The number of hashes found with the nonce is: {nonce}")
            numberhashesfound=nonce
            print(f"The valid hash found is: {hash_attempt}") # Display the
↳hash that meets the required difficulty level
            print(f"The total number of valid hashes found is:
↳{valid_hashes_found_count}")

```

[37]: bitcoin_mining(block_number, transactions, previous_hash)

```

The number of hashes found with the nonce is: 184
The valid hash found is:
006540201ea0da691294162aeaa8aee2a3819a7822cbbcc6c27eb50e66170234

4 SHA-256 BLOCK HASH CALCULATION

```
[ ]: combined_text=str(block_number)+transactions+previous_hash+str(numberhashesfound)
      ↪ # Create the data string to calculate the block's SHA-256 hash
final_hash_block=hashlib.sha256(combined_text.encode()).hexdigest() # Calculate
      ↪ the final SHA-256 hash of the block
print(f"The SHA-256 hash of the mined block is: {final_hash_block}")
print()
program_exit=input("Press ENTER to exit the program...")
```

The SHA-256 hash of the mined block is:
0094d137b185b816e104154aa4fad16ea3ee172bf0757afb84e4a598c2a9876f
